Discover how graph algorithms can help you leverage the relationships within your data to develop more intelligent solutions and enhance your machine learning models. You'll learn how graph analytics are uniquely suited to unfold complex structures and reveal difficult-to-find patterns lurking in your data. Whether you are trying to build dynamic network models or forecast real-world behavior, this book illustrates how graph algorithms deliver value—from finding vulnerabilities and bottlenecks to detecting communities and improving machine learning predictions. This practical book walks you through hands-on examples of how to use graph algorithms in Apache Spark and Neo4j—two of the most common choices for graph analytics. Also included: sample code and tips for over 20 practical graph algorithms that cover optimal pathfinding, importance through centrality, and community detection. Learn how graph analytics vary from conventional statistical analysis Understand how classic graph algorithms work, and how they are applied Get guidance on which algorithms to use for different types of questions Explore algorithm examples with working code and sample datasets from Spark and Neo4j See how connected feature extraction can increase machine learning accuracy and precision Walk through creating an ML workflow for link prediction combining Neo4j and Spark

with the most complete array of samples of any writing guide of this nature. The text continues its extremely thorough and accurate coverage of citation styles for a wide variety of disciplines. "Covering 'Big Brother' weaves together two fundamental concerns about cotemporary politics and mass media: (1) the tension between national security and civil liberties that was thrust center stage by the War on Terror following the 9/11 attacks and reemerged as a defining issue with Edward Snowden's revelations about the scope of the surveillance state, and (2) the power of media to render targeted groups suspicious and spur support for government surveillance powers. Doug McLeod and Dhavan Shah provide models for studying the influence of media content, particularly how the framing of media coverage, driven by choices journalists to personify the news, have sweeping implications for public willingness to sacrifice civil liberties in the interest of protecting national security. Covering 'Big Brother' is a seminal and timely text that traces how news production shapes citizens' judgments about tolerance and participation, written to be accessible to general audiences but rich with details for specialists"--

Now in its second edition, this book focuses on practical algorithms for mining data from even the largest datasets.

interconnectivity. In this book, we present a concise unified view on the basic challenges which arise over the complete life cycle of formulating and processing queries on graph databases. To that purpose, we present all major concepts relevant to this life cycle, formulated in terms of a common and unifying ground: the property graph data model—the predominant data model adopted by modern graph database systems. We aim especially to give a coherent and in-depth perspective on current graph querying and an outlook for future developments. Our presentation is self-contained, covering the relevant topics from: graph data models, graph query languages and graph query specification, graph constraints, and graph query processing. We conclude by indicating major open research challenges towards the next generation of graph data management systems.
