In chassis development, the three aspects of safety, vehicle dynamics and ride comfort are at the top of the list of challenges to be faced. Addressing this triad of challenges becomes even more complex when the chassis is required to interact with assistance systems and other systems for fully automated driving. What is more, new demands are created by the introduction of modern electric and electronic architectures. All these requirements must be met by the chassis, together with its

subsystems, the steering, brakes, tires and wheels. At the same time, all physical relationships and interactions have to be taken into account.

"Three youths of perhaps twenty years of age were making their way through the forest. The locality was about fifty miles from Ninety-Six, in South Carolina, and Ninety-Six was so called because it was approximately that number of miles from Fort Price George. This was the nearest fort of any size. The three youths were no others than Dick and Tom Dare, and their comrade, Ben Foster, who had been members of the patriot army of America for a considerable period--for it was now May of the year 1781. These youths, who had done brave fighting, were also famous for having done much good work as scouts, messengers and spies, and they were now on a scouting and spying expedition, ordered by General Greene, their company having been sent down from Virginia into South Carolina to help General Greene. The objective point was Ninety-Six, but there had been lots of fighting to do with parties of British and Tories, and the advance southward had been slow. Hearing that the Cherokee Indians were on the warpath, having been incited thereto by the British, and that [...]."

The rapid progress of information technology allows for increasingly powerful software intensive embedded systems (machines) executing integrated applications connected by and to global networks. Thus these systems are more and more networked among each other, but also with data and services on the Internet.

Intelligent solutions originate which gather processes of the living environment by means of sensors and actuators, connect them to virtual software worlds and interpret, monitor and control these processes in interaction with people. In this way, so-called Cyber-Physical Systems evolve – a living in a networked world. The interlocking applications include smart cities, social infrastructures with integrated telemedicine care, enhanced connected mobility with fully or semi-autonomous driving cars and traffic systems, safety, security and privacy as well as networked production and the sustainable energy turnaround. The integrated research agenda Cyber-Physical-Systems (agendaCPS) provides a comprehensive overview of the capabilities and benefits of the arising CPS-applications and manifold technological and social challenges involved. The agenda illustrates which value the subject for economy and society has: revolutionary applications of Cyber-Physical Systems address technological and social trends and needs; at the same time they penetrate and interconnect more and more areas of life. On the basis of concrete future scenarios essential application domains are shown. Their analysis reveals which capabilities and technologies form the basis of Cyber-Physical systems and which innovation and possible conflict potential is inherent. The agendaCPS makes clear which research and action areas are of particular importance. In these contexts opportunities, but also risks become apparent for Germany by Cyber-Physical Systems. This is the English translation of the report agenda Cyber-Physical Systems finished three years ago as a German acatech project by a German publication.

This book analyses the legal approach to personal data taken by different fields of law. An increasing number of business models in the digital economy rely on personal data as a key input. In exchange for sharing their data, online users benefit from personalized and innovative services. But companies' collection and use of personal data raise questions about privacy and fundamental rights. Moreover, given the substantial commercial and strategic value of personal data, their accumulation, control and use may raise competition concerns and negatively affect consumers. To establish a legal framework that ensures an adequate level of protection of personal data while at the same time providing an open and level playing field for businesses to develop innovative data-based services is a challenging task. With this objective in mind and against the background of the uniform rules set by the EU General Data Protection Regulation, the contributions to this book examine the significance and legal treatment of personal data in competition law, consumer protection law, general civil law and intellectual property law. Instead of providing an isolated analysis of the different areas of law, the book focuses on both synergies and tensions between the different legal fields, exploring potential ways to develop an integrated legal approach to personal data.
