Your vessel may be equipped with the most advanced technology and the most powerful engines, but the failure to apply the basic principles of bridge resource management can still prevent you from getting where you are going. Satellite systems, ARPA, electronic charts, AIS, sophisticated communication equipment and integrated navigational systems—all these advanced technologies provide valuable capabilities. But accidents still happen, and they usually involve human error. This simple fact has made Bridge Resource Management (BRM) training a requirement for watchkeepers worldwide. Bridge Resource Management for Small Ships: The Watchkeeper's Manual for Limited-Tonnage Vessels is the first book to address the unique needs of operators of small ships (limited-tonnage vessels) including tugs, ferries, yachts, and other passenger-carrying vessels. Features: Case histories to illustrate important points A complete course in BRM, suited for studying on your own as well as a complement to your classwork Topics include: Introduction to BRM, Standard Operating Procedures, Passage Planning, Implementing the Passage Plan, Building a Passage Plan, Situational Awareness and Human Factors, including: Overreliance, Distraction, Stress, Fatigue, Complacency, and Transition; and Human Interactions, including Communications, Teams and Teamwork, Decision Making and Leadership, and Human Error

Hiroaki Kobayashi has trained 1500 mariners in ship handling over twenty years and he has systematized the methods of safe navigation into nine elemental techniques. Taking a rigorous and scientific look at good practice and attitudes, good seamanship can be viewed as a series of concrete technical functions, which can be in terms of competencies. By giving proper attention to human factors the conditions for maintaining system safety can be defined, and the interaction of human competencies and environmental conditions and their effects on system safety can be recognised. System safety in turn depends on good bridge team management, with particular emphasis on communication, cooperation and leadership - communication for the exchange of information, cooperation to smooth team activities, and leadership to ensure that each member of the team performs successfully.

Marine accidents can occur at any time and everywhere in the world, resulting in loss of life, property, environment and reputation of the companies involved. Preventing accidents and establishing a safer world without accidents is an important agenda for the maritime industry. Since the enforcement of the International Safety Management Code in 1998, companies have taken various kinds of measures to prevent accidents. Unfortunately, measures have been undertaken in a disorganized manner, and have not been effective. Experts of risk management, the safety management system, and accident models have each undertaken accident preventive measures within the scope of their specific fields, but have not looked beyond the realm of their own fields. This book discusses systematic accident prevention by integrating multi-disciplinary expertise based on academic research, the quality management system which has already proved its effectiveness in other fields, and findings of the author's research. In systematic accident prevention, the weaknesses of a system within which accidents and incidents have occurred are viewed by combining scientific accident investigation data based on the International Maritime Organization model and the accident model. The nature of every type of marine accident, such as collisions, groundings, occupational casualties, etc., are derived by combining the accident model and statistical data. System weaknesses are rectified by the risk reduction method of risk management, and the rectified performance is incorporated in improvement in the system by the PDCA cycle, which is the core of the Safety Management System. We can see the weakness in the system and reduce the number of accidents and incidents while utilizing limited resources optimally to prevent accidents and incidents.

This volume collects the papers presented at the 2005 Annual General Assembly and Conference of the International Association of Maritime Universities (IAMU), which was held in Malmo, Sweden from 24 to 26 October 2005, and hosted by the World Maritime University. Section 1 presents interim and final reports on several research projects funded by IAMU. Section 2 presents a broad range of academic papers on the theme of maritime Security and MET. These range from the challenges faced by MET institutions worldwide in incorporating the new topic of maritime security into their syllabi, to the economic costs of the new maritime security regime to the shipping industry and to ports. Other topics are also covered, including the technical means of monitoring the movements of ships, and the social implications for seafarers on board ships. Section 3 includes papers on a variety of current MET issues, such as bridge resource management, quality management in MET, careers at sea, and ship handling and marine engineering simulators.
