Language is central to our existence and it happens to be the most sophisticated product of the human mind. It is inconceivable to think of ourselves, our societies, our ideas, cultures or identities without language. It is the primary means of socialization, and whatever we know is a result of it. It is the primary medium of construction and dissemination of knowledge, and structures our thought processes in important ways that constitute our identity. In very complex ways, it interacts with the social, political and economic power structures that remain significant in defining the identities of individuals and societies. The essays in this volume create an awareness and understanding about the role of linguistic context in negotiating identity. The book explains identity and the complex relations between language and several aspects of our society. It explores identity through text and context, and will serve to trigger a novel discourse around the centrality of identity in contemporary society.

The fundamental mathematical tools needed to understand machine learning include linear algebra,

analytic geometry, matrix decompositions, vector calculus, optimization, probability and statistics. These topics are traditionally taught in disparate courses, making it hard for data science or computer science students, or professionals, to efficiently learn the mathematics. This self-contained textbook bridges the gap between mathematical and machine learning texts, introducing the mathematical concepts with a minimum of prerequisites. It uses these concepts to derive four central machine learning methods: linear regression, principal component analysis, Gaussian mixture models and support vector machines. For students and others with a mathematical background, these derivations provide a starting point to machine learning texts. For those learning the mathematics for the first time, the methods help build intuition and practical experience with applying mathematical concepts. Every chapter includes worked examples and exercises to test understanding. Programming tutorials are offered on the book's web site.

This book contains the proceedings of the 1983 Seminar on Quadratic and Hermitian Forms held at McMaster University, July 1983. Between 1945 and 1965, most of the work in quadratic (and hermitian) forms took place in arithmetic theory (M. Eichler, M. Kneser, O. T. O'Meara). In the mid-sixties, the algebraic theory of quadratic forms experienced a reawakening with the fundamental discoveries of A. Pfister. More recently, there have been signs that the subject, in both its algebraic and arithmetic aspects, is once more in a state of change, reaching out into new and different areas. Since the advent of surgery theory in the late sixties, that subject has been one of the principal users of the theory of quadratic and hermitian forms. Therefore, hermitian K -theory was included within the scope of the conference to further the contact between its practitioners and those in quadratic forms.
