Tanks have to sustain high-quality serviceability over a long lifespan. This text covers computing the stresses in service in several chapters. It considers thermal stresses and the time-dependent stresses produced by creep and shrinkage of

relaxation of prestressed steel. It also examines the effects of cracking and the means for its control. This text is universally applicable; no specific system of units is used in most solved examples.

However, it is

advantageous to use actual dimensions and forces on the structure in a small number of examples. These problems are set in SI units and Imperial units; the answers and the graphs related to these examples are given in the two

Previous papers have described wind tunnel measurements on isolated and grouped storage bins, silos and tanks of circular cross-section. In this paper, distributions of fluctuating and

Peak pressures on the walls of both isolated and grouped silos are described. They were generated using the techniques of eigenvector analysis of the covariance matrix, and "coincident peak" sampling.
