There are 3 types of

RNA, and each plays an important role in protein synthesis.

Messenger RNA (mRNA) brings the genetic details from DNA into the cytoplasm to the ribosomes, the sites of protein synthesis. This details is brought by the series of bases in mRNA, which is complementary to the series of bases in the

Ribosomal RNA

Messenger RNA

the ribosomes in the cell
cytoplasm, where
protein synthesis occurs
(Figure 3). The base
triplets of transfer RNA
(tRNA) pair with those
of mRNA and at the
same time deposit their
amino acids on the
growing protein chain.

genetic information that is contained in DNA is re-written into messenger RNA (mRNA) by an RNA polymerase enzyme.

The synthesized mRNA is transported out of the cell nucleus where it will later on aid in the synthesis of proteins by the mechanism of translation.
