En este libro se presenta el contenido de un curso de Econometría para estudiantes de las licenciaturas en Ciencias Económicas y Empresariales. En la primera parte se tratan de los modelos uniecuacionales, con una amplitud superior a la habitual en los cursos de Estadística aplicada, y poniendo énfasis en los problemas que se presentan en la modelización económica y en los modelos con variables cualitativas. En la segunda parte se estudian los modelos multiecuacionales, y la última está dedicada a la teoría de series temporales y modelos dinámicos, incluyendo la metodología de Box-Jenkins, el análisis espectral y los métodos clásicos de análisis de series. En el texto se presentan numerosos problemas resueltos y propuestos, así como una introducción a los paquetes de programas econométricos, con los que se elaboran los ejemplos. Todos los conjuntos de datos manejados en los ejemplos están contenidos en un disquete adjunto, así como algunos programas auxiliares usados en el texto. También están disponibles un juego de transparencias que corresponden a los temas y ejemplos.

v.1: Economic-development - concepts and approaches; Structural transformation; Human resources and labor markets; v.2: Planning and resource allocation; International aspect; Country experience with development.

This groundbreaking new core textbook encourages students to take a more critical approach to the prevalent assumptions around the subject of macroeconomics, by comparing and contrasting heterodox and orthodox approaches to theory and policy. The first such textbook to develop a heterodox model from the ground up, it is based on the principles of Modern Monetary Theory (MMT) as derived from the theories of Keynes, Kalecki, Veblen, Marx, and Minsky, amongst others. The internationally-respected author team offer appropriate fiscal and monetary policy recommendations, explaining how the poor economic performance of most of the wealthy capitalist countries over recent decades could have been avoided, and delivering a well-reasoned practical and philosophical argument for the heterodox MMT approach being advocated. The book is suitable for both introductory and intermediate courses, offering a thorough overview of the basics and valuable historical context, while covering everything needed for more advanced courses. Issues are explained conceptually, with the more technical, mathematical material in chapter appendices, offering greater flexibility of use.

Current research often highlights the importance of financial markets as well as financial system development. However, the current literature in this field still fails to adequately explain the relationship between financial market and macroeconomic development. Post-Keynesian Empirical Research and the Debate on Financial Market Development integrates the concept of financial intermediaries with Post-Keynesian macroeconomic modeling to discuss the relationship between financial markets and systems and macroeconomic development. Discussing key macroeconomic variables such as investment, savings, and productivity growth, this timely resource is essential for students, academicians, as well as finance and economics professionals interested in uncovering the latest research in this field.

An indispensable reference work for anyone interested in Latin America's economic development.
