Excerpt from Parallel Operation of Synchronous Machines: Thesis for Degree of Electrical Engineer in Electrical Engineering; College of Engineering, University of Illinois; Presented June, 1907 Equality of frequency is taken to mean that the machines must Operate together at the same frequency without excessive strains, either mechanical or electrical, upon them. Unless this condition exists, the machines can never be made to Operate satisfactorily together. The condition of inequality of frequency is that which occurs when two machines are belted to the same line shaft with pulley ratios such that the frequencies can never be the same. If two such machines are connected in parallel a current will flow between them. This current is a load current, and will load the machine of higher frequency to such a point as to supply sufficient power to cause the belts to slip; or the motor action on the machine of lower frequency will become so great that it will not hold in step, but will periodically fall in and out of step as the vectors come together and again separate. Any such Operation is, evidently, out of the question. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books.
