There have been significant changes to farming and forestry, and new strategies for agriculture, forestry and biodiversity have been launched. The influence of farming and forestry on Scotland's landscapes is seen as increasingly important, and new access rights have been put in place by the Land Reform (Scotland) Act 2003. Although these changes bring uncertainty and challenges, they also bring a major opportunity to move decisively towards integrating landscape, biodiversity and recreational objectives in land management. This book takes stock of the changes taking place and considers a number of case studies, which together suggest that progress is being made, looks ahead at future research and advisory needs, and highlights some key challenges to achieving better integration in the future.

Golf Course Management & Construction presents a comprehensive summary and assessment of technical and scientific research on the environmental effects of turfgrass system construction and maintenance. Although the book focuses on golf courses, it also discusses turfgrass systems for residential and commercial lawns, parks, and greenways. The book is an excellent introduction to the concepts of nonpoint source environmental impacts of turfgrass management for turfgrass scientists and specialists, landscape and golf course architects, turfgrass system and golf course developers, golf course superintendents, environmental scientists, and land-use regulators.

Risk analysis is not a narrowly defined set of applications. Rather, it is widely used to assess and manage a plethora of hazards that threaten dire implications. However, too few people actually understand what risk analysis can help us accomplish and, even among experts, knowledge is often limited to one or two applications. Explaining Risk Analysis frames risk analysis as a holistic planning process aimed at making better risk-informed decisions and emphasizing the connections between the parts. This framework requires an understanding of basic terms, including explanations of why there is no universal agreement about what risk means, much less risk assessment, risk management and risk analysis. Drawing on a wide range of case studies, the book illustrates the ways in which risk analysis can help lead to better decisions in a variety of scenarios, including the destruction of chemical weapons, management of nuclear waste and the response to passenger rail threats. The book demonstrates how the risk analysis process and the data, models and processes used in risk analysis will clarify, rather than obfuscate, decision-makers' options. This book will be of great interest to students and scholars of risk assessment, risk management, public health, environmental science, environmental economics and environmental psychology.

At the Fundy National Park golf course, fungicides containing mercury were applied to greens between 1949 and 1983, and mercury contamination still persists on the course. This report summarizes three 1995 studies to provide an assessment of that contamination. An Environment Canada study documented potential environmental contamination from the use of

mercury-based fungicides on golf course greens in Atlantic Canada. Another study by GEMTEC provided a more detailed valuation of the magnitude and distribution of mercury contamination at the Fundy National Park course by analyzing samples of soil, water, grass, and sediment. The third study involved a human health risk assessment using data from the GEMTEC study and results from air samples collected on a hot summer day. Methodology employed included hazard identification, toxicity assessment, and risk characterization.

Human and Ecological Risk Assessment: Theory and Practice assembles the expertise of more than fifty authorities from fifteen different fields, forming a comprehensive reference and textbook on risk assessment. Containing two dozen case studies of environmental or human health risk assessments, the text not only presents the theoretical underpinnings of the discipline, but also serves as a complete handbook and "how-to" guide for individuals conducting or interpreting risk assessments. In addition, more than 4,000 published papers and books in the field are cited. Editor Dennis Paustenbach has assembled chapters that present the most current methods for conducting hazard identification, dose-response and exposure assessment, and risk characterization components for risk assessments of any chemical hazard to humans or wildlife (fish, birds, and terrestrials). Topics addressed include hazards posed by: Air emissions Radiological hazards Contaminated soil and foods Agricultural hazards Occupational hazards Consumer products and water Hazardous waste sites Contaminated air and water The bringing together of so many of the world's authorities on these topics, plus the comprehensive nature of the text, promises to make Human and Ecological Risk Assessment the text against which others will be measured in the coming years.
