edition's enhanced ecological perspective details the ongoing environmental challenges endured by these fragile life-forms. Viewing the structure and function of marine plant communities in the context of abiotic (light, temperature, water movement, nutrients), biotic (photosynthesis, carbon fixation, competition, predation, symbiosis), and anthropogenic influences, the book moves layer by layer through the ocean, capturing their photosynthetic and adaptive mechanisms. Pollution in the form of oil spills, heavy and radioactive metals, biological damage wrought from harvesting and aquaculture, and the harmful effects of ozone depletion and UV-B rays are detailed, along with the impact of environmental factors on morphological and anatomical adaptations. The book also describes the anthropogenic stresses endured by salt marshes, mangals, seagrass

Some are simple globules and spheres, consisting of a single cellule, a little bag of tissue filled with colouring matter; some are mere strings of such cellules, cohering by the ends; others, a little more perfect, exhibit the appearance of branched threads; in others, again, the branches and threads are compound, consisting of several such threads joined together; and in others the tissue expands into broad fiat fronds (leaves).
