Are you having trouble demonstrating to management what a manufacturing execution system (MES) is and what it can do for you? Or do you simply need to justify why you even need a MES? Perhaps you are the executive decision maker and just need some answers. Bianca Scholten, the author of the best-selling book, The Road to Integration: Applying ISA-95 in

Manufacturing, shares her expertise on the topic in her latest easy-to-read guide to MES. In recent decades, says Scholten, industrial companies have invested much time and money in not only machine and production line automation but also in ERP (Enterprise Resource Planning) systems. The MES falls between these two layers. Many of the preparatory activities (e.g., detailed production scheduling and recipe management), but also retrospective activities (e.g., data collection, reporting, and analysis) are primitive at best. Ideal for CEOs, CFOs, and managers, Scholten sheds some light on how to get out of this outdated situation using real-world examples and the knowledge gleaned from IT, production managers, and other colleagues who have been through the MES experience. She covers MES selection, company expectations during implementation and initial use of the MES, advice on developing and maintaining a multi-site MES template, and return on investment. She also adds a bird's-eye view of the ISA-95 standard for better communication between systems and their applications.

Decisive potential in business is a question of process capability, rather than production capability. Process capability in business requires real-time systems for optimization. Business-IT needs to be developed from telecommunications and ERP to real-time services, which are not offered by the prevailing ERP systems. This book shows how modern information technology Manufacturing Execution Systems (MES) becomes the prerequisite for process capability of the company on the basis of many practical examples. It describes the requirements for optimized MES. It gives an overview of the efficiency potentials and different applications of

Manufacturing Execution System (MES) is the central part and data hub in a manufacturing environment, connecting ERP and shop floor through horizontal and vertical integration. As a perfect example of modern and Industry 4.0 orientated MES, HYDRA is described, basically modular structured with plenty of standard functions, covering all production areas and departments in a factory, such as machine connectivity, production management, production logistics, quality management, resource management, energy management, and HR. Collecting vast real-time production data is just the very first step, where many MES systems linger about. More important is to analyze and utilize mass production data, turning Big Data into Smart Data. MES Hydra offers various analysis tools and reports for the sake of efficiency and transparency.

In recent decades, industrial companies have invested much time and money in enterprise resource planning (ERP) systems and in automation of the process control layer. In our quest to reap the rewards of all these investments, the gap between business automation and process automation is becoming painfully obvious. ERP systems are only valuable if you supply them with current data, and these data originate largely from the process control layer. When integrating these systems, both IT departments and engineering departments must confront the high degree of heterogeneity found in technology, metadata,

programming languages, user interfaces, and more. Good communication with the system's end user is essential as several departments are usually involved, such as production, maintenance, the lab, and the office. Try speaking the same language then! Against this backdrop, ISA decided in the 1990s to develop the ISA-95 standard for integrating enterprise and control systems in order to reduce the risks, costs, and errors that go hand in hand with implementing manufacturing control systems and integrating them with ERP systems. This handy resource explains how to apply ISA-95 in manufacturing enterprise systems (MES) and vertical integration projects, as well as reveals the most important ISA-95 models and terminology. It is ideal for those just starting out who need to get up to speed on ISA-95's background information but also for those who have some practical experience with ISA-95 and require additional support in carrying out analyses to determine a specific company's MES strategy and to define user requirements. If you develop MES functionality or realize interfaces based on ISA-95, then this guide will help you understand and apply the ISA-95 object models. Most important, the guide explains how to integrate ERP and MES systems using ISA-95. It places ISA-95 in the broader context of modern information exchange technologies and thus offers a complete picture for project managers, consultants, programmers, and information architects who want to integrate ERP and MES systems based on the international standard.

All organizations operate in an environment that is rapidly changing. To be successful, the organization must also change. The question is what to change and

how. This book will describe in some detail a number of management programs, many of which are known by their three-letter acronyms, such as Just-in-Time (JIT) or Service-Oriented Architecture (SOA). A management program is designed to improve an organization ' s effectiveness and efficiency. However, there are so many management programs it is often difficult for managers to decide which one would be most appropriate for their operation. This book will describe an array of management programs and group them to indicate their primary purpose. The book will also outline a process that will enable managers to select the most appropriate management program to meet their immediate and long-term needs.

Implementing a management program is no small task. It can be expensive, time-consuming, and disruptive of normal operations; therefore, the choice of the management program requires careful selection and implementation. Care must be taken to increase the likelihood of successfully implementing new ventures in all types of organizations – business, nonprofit and governmental agencies. Many ventures fail, or achieve limited success, not because the idea isn ' t good but because the organization has not adequately prepared its internal capabilities to meet the environmental conditions in which it operates. An important feature of this book is that it can be updated periodically to add new programs and phase out programs no longer relevant. The book will provide readers with a comprehensive description of the most popular management improvement programs and their primary applications to their organizations. We will discuss the philosophy and principles of these programs and include a discussion on how to use each program to

achieve optimum success. A central theme of this book is to not just adopt an improvement program for the sake of adopting it, but to match the improvement program with the specific needs in an organization. In the chapters that follow, we will illustrate how this matching process can be conducted. Above all, we plan the book to be a concise and useful resource to both practitioners and academics. Here is what you can expect in the chapters.

This volume contains the edited technical presentations of PROLMAT 2006, the IFIP TC5 international conference held on June 15-17, 2006 at the Shanghai University in China. The papers collected here concentrate on knowledge strategies in Product Life Cycle and bring together researchers and industrialists with the objective of reaching a mutual understanding of the scientific - industry dichotomy, while facilitating the transfer of core research knowledge to core industrial competencies.
