It has been noted by many authors that nurses comprise the largest percentage of health care providers in the United States. At various times in the history of the profession, nursing shortages have existed due to a variety of factors. This paper will not only provide a description of nursing shortages in the past, but it also discusses the current nursing shortage in the United States. This paper uses research by means of literary analysis on the topic of the United States nursing shortage and there were no gaps identified in the literature review. First, a brief history of nursing shortages is provided. Contributing factors to the shortage such as retiring baby boomers, decreased numbers of nursing faculty, and an expansion in nurse workloads are examined. Several solutions to combat the shortage were discovered in the literature review. Retaining aging nurses, increasing faculty and student enrollments in nursing programs, and ways to reduce nurse burnout are investigated. Nurses need to promote nursing as a profession to students as a potential career choice. Future projections of the nursing shortage across the United States will necessitate innovative solutions to address this far-reaching problem.

Over the many years nurses have been struggling with a big issue for them at many healthcare facilities. This problem is ever present, and its solution has been thought about but never been answered. The problem is the nursing shortage. Research has shown as well as experience this is an ever growing problem that not only in the United States is facing but many other countries as well. This essay shows the problem and reasons for it. The way to go about solving the nursing shortage as well as using different methods to help facilitate the problem and even help the situation be improved will help nurses to experience a less of a shortage. This paper offers a solution, a way to help implement the plan, a way to spread the plan amongst the nation in the United States and how we can evaluate the plan over a period of time. The nursing shortage is a big deal and the problem is inevitable and cannot be avoided and by put off any longer, it is important that this problem be solved soon and this paper is here to address this problem. The more than one solution and methods mentioned should be enough to get started to help less the burden most nurses have at the work place due to the under staffing of nurses because there are not enough nurses out there. With enough evidence and explanation this paper will be a basis for most and all nurses to be an interactive as well as an imperative part to help close the gap.

The Future of Nursing explores how nurses' roles, responsibilities, and education should change significantly to meet the increased demand for care that will be created by health care reform and to advance improvements in America's increasingly complex health system. At more than 3 million in number, nurses make up the single largest segment of the health care work force. They also spend the greatest amount of time in delivering patient care as a profession. Nurses therefore have valuable insights and unique abilities to contribute as partners with other health care professionals in improving the quality and safety of care as envisioned in the Affordable Care Act (ACA) enacted this year. Nurses should be fully engaged with other health professionals and assume leadership roles in redesigning care in the United

States. To ensure its members are well-prepared, the profession should institute residency training for nurses, increase the percentage of nurses who attain a bachelor's degree to 80 percent by 2020, and double the number who pursue doctorates. Furthermore, regulatory and institutional obstacles -- including limits on nurses' scope of practice -- should be removed so that the health system can reap the full benefit of nurses' training, skills, and knowledge in patient care. In this book, the Institute of Medicine makes recommendations for an action-oriented blueprint for the future of nursing.

"Nurses play a vital role in improving the safety and quality of patient care -- not only in the hospital or ambulatory treatment facility, but also of community-based care and the care performed by family members. Nurses need know what proven techniques and interventions they can use to enhance patient outcomes. To address this need, the Agency for Healthcare Research and Quality (AHRQ), with additional funding from the Robert Wood Johnson Foundation, has prepared this comprehensive, 1,400-page, handbook for nurses on patient safety and quality -- Patient Safety and Quality: An Evidence-Based Handbook for Nurses. (AHRQ Publication No. 08-0043)."--Online AHRQ blurb, <http://www.ahrq.gov/qual/nursesfdbk>.

The Future of the Nursing Workforce in the United States: Data, Trends and Implications provides a timely, comprehensive, and integrated body of data supported by rich discussion of the forces shaping the nursing workforce in the US. Using plain, jargon free language, the book identifies and describes the key changes in the current nursing workforce and provide insights about what is likely to develop in the future. The Future of the Nursing Workforce offers an in-depth discussion of specific policy options to help employers, educators, and policymakers design and implement actions aimed at strengthening the current and future RN workforce. The only book of its kind, this renowned author team presents extensive data, exhibits and tables on the nurse labor market, how the composition of the workforce is evolving, changes occurring in the work environment where nurses practice their profession, and on the public's opinion of the nursing profession.

President Bush has declared that ending the nursing shortage is a national priority. The shortage of Army nurses jeopardizes military beneficiaries' health care. An insufficient supply of nurses threatens force protection and emergency preparedness of our public health system, which must prepare to respond effectively to attacks by weapons of mass destruction. Factors contributing to the registered nurse shortage are impacting recruitment of Army nurses. Further, the low retention rates among junior active duty Army nurses exacerbate the problem. Departing nurses cite several concerns and desires to begin a family, not to work fulltime, and to remain in the same duty location. Implementation of preemptive strategies will ensure an adequate supply of active duty Army nurses in the pipeline to provide quality health care to retirees and military family members in the homeland, and especially to troops operating in volatile, uncertain, complex, and ambiguous environments. Corrective strategies should include policy and regulation changes, more economic incentives, and establishment of an undergraduate School of Nursing within the United States Uniformed Services of the Health Sciences for all services. This Strategy Research Paper (SRP) describes the global nursing shortage. It analyzes the reasons for the shortage of non-Department of Defense civilian nurses, comparing them with the reasons for the shortage of nurses in the Army. It outlines the implications of the nurse shortage for health care beneficiaries. It reviews findings from Army Nurse Corps exit surveys. It discusses current strategic initiatives. It provides recommendations to achieve and sustain sufficient numbers of Army nurses to continue supporting the Army Medical Department goals and transformation initiatives in the face of a nationwide health care crisis. It raises critical questions for further examination: What impact will the availability of onsite child care services for shift workers have on AMEDD retention? What is the correlation between age of active duty Army nurses and personal military readiness? Will ending the shortage of nurses in the Army depend on ending the shortage of nurses in the civilian sector?

During clinical practice the author of this research paper has become aware of declining nurse retention rates amongst new graduate nurses in critical care areas. This can be attributed to a lack of support received by the new graduate nurse. The nursing shortage has burdened many hospitals with poor staffing and decreasing job satisfaction, ultimately leading to decreased retention rates. A question to be asked is, for new graduate nurses in the critical care setting, will participation in a nurse residency program as opposed to the traditional 6 week orientation, increase retention? By organizations implementing new graduate nurse training programs, many hospitals have seen retention rates rise. Implementation of a new graduate training or mentorship program will increase new graduate nurse retention; thus increase overall staffing. Due to a lack of experienced nurses applying to specialty areas, hiring new graduates and training them allows for experience to be built. The following paper will discuss how the implementation of new graduate nurse training/mentorship programs will help to increase the rate of nurse retention. The implementation of mentorship programs is an essential element that health care institutions employ to retain nurses who have graduated nursing school and have obtained licensure (Chen, and Lou, 2014). By understanding how the effectiveness of these mentorship programs work, the retention rate for these nurses can be improved (Chen, and Lou 2014).

Hospitals and nursing homes are responding to changes in the health care system by modifying staffing levels and the mix of nursing personnel. But do these changes endanger the quality of patient care? Do nursing staff suffer increased rates of injury, illness, or stress because of changing workplace demands? These questions are addressed in Nursing Staff in Hospitals and Nursing Homes, a thorough and authoritative look at today's health care system that also takes a long-term view of staffing needs for nursing as the nation moves into the next century. The committee draws fundamental conclusions about the evolving role of nurses in hospitals and nursing homes and presents recommendations about staffing decisions, nursing training, measurement of quality, reimbursement, and other areas. The volume also discusses work-related injuries, violence toward and abuse of nursing staffs, and stress among nursing personnel--and examines whether these problems are related to staffing levels. Included is a readable overview of the underlying trends in health care that have given rise to urgent questions about nurse staffing: population changes, budget pressures, and the introduction of new technologies. Nursing Staff in Hospitals and Nursing Homes provides a straightforward examination of complex and sensitive issues surround the role and value of nursing on our health care system.
