Plants, People, Planet is a multi-disciplinary Open Access journal, owned by the New Phytologist Foundation and published by Wiley. The journal promotes outstanding plant-based research in its broadest sense and celebrates everything new, innovative and exciting in plant-focused research that is relevant to society and people’s daily lives.

Plants, People, Planet—New Phytologist Trust

Plants, People, Planet—Journals—New Phytologist

Other than the occasional houseplant, or backyard garden, few people give a lot of thought to the plants around them, yet plants form an integral part of our world. We depend on them for food. We use them to build. We harvest them for fuel, and even for fashion. Plants, People, and the Planet explores the critical role plants play in our lives, and in our societies. It explains plants, from their molecular structure to their place on the dinner table. The book addresses contemporary issues in horticulture, and how these issues impact the planet. Topics covered in the book include: plant products and their uses, plant biology and morphology, plant genealogy and geography, the meaning of "organic," field-covering crops, food plants, and sustainability. Written in an accessible and readable style, Plants, People, and the Planet is ideal for introductory courses in horticulture, plant sciences, and sustainability. Dr. Nathaniel Mitkowski is a professor of plant pathology in the Department of Plant Sciences at the University of Rhode Island. He teaches introductory horticulture and numerous upper level classes in turf and ornamental pathology, turfgrass management and plant improvement. His research is split between diseases of turfgrasses and plant-parasitic nematodes. He has authored dozens of papers on turfgrass and nematode diseases and is nationally recognized for his work in these fields. He received a Ph.D in plant pathology from Cornell University in 2001. Dr. Bridget Ruummele is a professor of plant breeding in the Department of Plant Sciences at the University of Rhode Island. She teaches introductory horticulture, turfgrass management, fruit culture, weed science and plant breeding and genetics. Her specialization is in turfgrass improvement and she has worked on the development of many different improved turfgrass varieties. She received her Ph.D in horticulture from the University of Minnesota in 1989.

Plants, People, Planet—Wiley Online Library

Simple steps can make an impact on our planet. From BuzzFeed’s Goodful, these 75 plant-based recipes plus plenty of low-waste strategies will guide you to a sustainable life you can feel good about. Goodful offers approachable recipes, tips, and guides for everyday life. In Plant and Planet, discover seventy-five plant-based recipes for meal prep, everyday celebrations, and cooking with the seasons, from Zucchini Lasagna Boats and Black Bean & Walnut Quesadillas to Caramelized Banana & Orange Parfaits, along with tons of ways to stock your kitchen, grow your own ingredients, turn your scraps into amazing treats, and more. Beautifully photographed, this cookbook is super practical and impactful, with surprising and easy ways to reduce environmental impact, shopping guides and meal plans, information about repurposing food waste, plus a guide to growing your own ingredients. You will learn how to:
• Approach cooking from a seasonal perspective
• Minimize packaging while maximizing flavor
• Clear out your fridge and freezer to make comforting soups, salads, and other dishes
Featuring contributions from experts DeVonn Francis, Lorena Ramirez, Lauren Singer, Nadiya Hussain, Kelis Rogers, David Zilber, and Ben Flanner, Plant and Planet is filled with tips and quick hits of information about the environmental impact of these recipes—all to deliver a low-stress, high-impact path to a low-waste kitchen.

Plants, People, Planet—Wiley Online Library

Wherever there is greenery, photosynthesis is working to make oxygen, release energy, and create living matter from the raw material of sunlight, water, and carbon dioxide. Without photosynthesis, there would be an empty world, an empty sky, and a sun that does nothing more than warm the rocks and reflect off the sea. Eating the Sun is the story of a world in crisis; an appreciation of the importance of plants; a history of the earth and the feuds and fantasies of warring scientists; a celebration of how the smallest things, enzymes and pigments, influence the largest things, the oceans, the rainforests, and the fossil fuel economy. Oliver Morton offers a fascinating, lively, profound look at nature’s greatest miracle and sounds a much-needed call to arms—illuminating a potential crisis of climatic chaos and explaining how we can change our situation, for better or for worse.

Plants, People, Planet—Wiley Online Library

Plants are not just a pretty part of the landscape; they keep the entire planet, with all of its human and nonhuman inhabitants, alive. Stanley Rice documents the many ways in which plants do this by making oxygen, regulating the greenhouse effect, controlling floods, and producing all the food in the world. Plants also create natural habitats for all organisms in the world. With illustrations and clear writing for non-specialists, Green Planet helps general readers realize that if we are to rescue the Earth from environmental disaster, we must protect wild plants. Beginning with an overview of how human civilization has altered the face of the Earth, particularly by the destruction of forests, the book details the startling consequences of these actions. Rice provides compelling reasons for government officials, economic leaders, and the public to support efforts to save threatened and endangered plants. Global campaigns to solve environmental problems with plants, such as the development of green roofs and the Green Belt Movement—a women’s organization in Kenya that empowers communities worldwide to protect the environment—show readers that efforts to save wild plants can be successful and beneficial to the economic well-being of nations. Through current scientific evidence, readers see that plants are vital to the ecological health of our planet and understand what can be done to lead to a better—and greener—future
Benefits of plants: Help modulate greenhouse gases Produce almost all oxygen in the air Create cool shade that reduces energy costs Prevent floods, droughts, and soil erosion Produce all of the food in the world Create and preserve soil Create natural habitats Heal the landscape after natural and human disasters

Plants, People, Planet—Wiley Online Library

'If we could all live and eat a little more like Tom the world and the food chain would be in much better shape.' Anna Jones
'This book is like a hybrid of Michael Pollan and Anna Jones. It combines serious food politics with flavour-packed modern recipes. This is a call-to-arms for a different way of eating which seeks to lead us there not through lectures but through a love of food, in all its vibrancy and variety.' Bee Wilson
Tom’s mission is to teach a way of eating that prioritises the environment without sacrificing pleasure, taste and nutrition. Tom’s manifesto, ‘Root to Fruit’ demonstrates how we can all become part of the solution, supporting a delicious, biodiverse and regenerative food system, giving us the skills and knowledge to shop, eat and cook sustainably, whilst eating healthier, better-tasting food for no extra cost.

Plants, People, Planet—Wiley Online Library

Plants have profoundly moulded the Earth’s climate and the evolutionary trajectory of life. Far from being ‘silent witnesses to the passage of time’, plants are dynamic components of our world, shaping the environment throughout history as much as that environment has shaped them. In The Emerald Planet, David Beerling puts plants centre stage, revealing the crucial role they have played in driving global changes in the environment, in recording hidden facets of Earth’s history, and in helping us to predict its future. His account draws together evidence from fossil plants, from experiments with their living counterparts, and from computer models of the ‘Earth System’, to illuminate the history of our planet and its biodiversity. This new approach reveals how plummeting carbon dioxide levels removed a barrier to the evolution of the leaf; how plants played a starring role in pushing oxygen levels upwards, allowing spectacular giant insects to thrive in the Carboniferous; and it strengthens fascinating and contentious fossil evidence for an ancient hole in the ozone layer. Along the way, Beerling introduces a lively cast of pioneering scientists from Victorian times onwards whose discoveries provided the crucial background to these and the other puzzles. This understanding of our planet’s past sheds a sobering light on our own climate-changing activities, and offers clues to what our climatic and ecological futures might look like. There could be no more important time to take a close look at plants, and to understand the history of the world through the stories they tell. Oxford Landmark Science books are ‘must-read’ classics of modern science writing which have crystallized big ideas, and shaped the way we think.

Discover the incredible story of how plant life grew to cover the surface of planet Earth, from long before human life existed up to the present day. This large-format, highly illustrated book will guide readers through the key aspects of the life of plants, from early ferns which were most certainly munched on by dinosaurs, to carnivorous plants that snap and 'attack' their prey, or powerful medicinal plants that can heal ailments and boost health. Mysterious and wonderful plants and trees are explored through the diverse habitats they're found in, from the Amazon Rainforest to the Sahara Desert, and through the animals found living on them or amongst them. This book also explores how humans use – and abuse – our precious plants, and how reliant we all are on the survival of our planet's network of botanical life. When Plants Took Over the Planet is the latest in the Incredible Evolution series, a beautifully illustrated set of books rich with facts about how life developed on the planet. Discover incredible stories of ancient species in When the Whales Walked, and explore the ancestry of the human race in When We Became Humans.

This activity book has been designed, written and illustrated to bring children and young people closer to the world of plant protection; the science that deals with plant health. Although addressed to an age group between eight and twelve years, this book can also be useful for older kids and educators. It can be considered as first, simple plant protection manual, designed on the occasion of the International Year of Plant Health 2020.
