Psychology Chapter 5: Sensation James Rowland Angell Table of Contents | Next | Previous. Rudimentary Forms of Knowledge.-- We now take up in detail the several forms of cognitive process through which we attain knowledge. This undertaking will necessarily involve our examining various aspects of consciousness one at a time, and we must unavoidably turn our backs temporarily on most of the processes, apart from the special one we are --for the moment engaged in studying.

Published by Sinauer Associates, an imprint of Oxford University Press. Sensation & Perception introduces students to their own senses, emphasizing human sensory and perceptual experience and the basic neuroscientific underpinnings of that experience. The authors, specialists in their respective domains, strive to spread their enthusiasm for fundamental questions about the human senses and the impact that answers to those questions can have on medical and societal issues.

"This book is designed to help students organize their thinking about psychology at a conceptual level. The focus on behaviour and empiricism has produced a text that is better organized, has fewer chapters, and is somewhat shorter than many of the leading books. The beginning of each section includes learning objectives; throughout the body of each section are key terms in bold followed by their definitions in italics; key takeaways, and exercises and critical thinking activities end each section"--BCcampus website.

Psychology is designed to meet scope and sequence requirements for the single-semester introduction to psychology course. The book offers a comprehensive treatment of core concepts, grounded in both classic studies and current and emerging research. The text also includes coverage of the DSM-5 in examinations of psychological disorders. Psychology incorporates discussions that reflect the diversity within the discipline, as well as the diversity of cultures and communities across the globe. Coverage and Scope This book is designed to make psychology, as a discipline, interesting and accessible to students research and examples that represent and include the various sociocultural backgrounds of the many students who take this course. The result is a book that covers the breadth of psychology topics with variety and depth that promote student engagement. The organization and pedagogical features were developed and vetted with feedback from psychology educators dedicated to the project. Infant Perception: From Sensation to Cognition, Volume II: Perception of Space, Speech, and Sound covers comprehensive programmatic examinations, which are arranged along a continuum from basic sensory and neurophysiological functioning to information processing and memory. This volume is organized into two parts encompassing six chapters, and begins with the difficulties prior research has had in assessing infant perception of depth or space. The next chapters provide a link between infants' perception of space and their perception of objects and evaluate both psychometric studies of object concept development and studies focusing specifically on Piaget's theory. These topics are followed by discussions of the infant's development of the concept of self, and that concept is used to explain the infant's perception of other persons. The final chapters deal with the infant vision and audition. These chapters specifically describe the developmental anatomy of the auditory pathway and the electrophysiological functioning and capacity. A series of studies on the infant's receptiveness for the segmental units of speech, the ability to perceive phonemic feature contrasts, and the manner in which this perception occurs is also provided. This book will prove useful to developmental psychologists and biologists.

This new edition continues the story of psychology with added research and enhanced content from the most dynamic areas of the field--cognition, gender and diversity studies, neuroscience and more, while at the same time using the most effective teaching approaches and learning tools.

Download File PDF Psychology Chapter 5 Sensation

In this fresh new offering to the Intro Psychology course, authors John Cacioppo and Laura Freberg portray psychology as being an integrative science in two ways. First, they have written a text that reflects psychology's rightful place as a hub science that draws from and is cited by research in many other fields. Second, this text presents psychology as a unified science that seeks a complete understanding of the human mind, rather than as a loosely organized set of autonomous subspecialties. As psychology moves rapidly toward maturity as an integrative, multidisciplinary field, the introductory course offers an opportunity to teach all of psychology in one place and at one time. This text reflects that evolution--and the authors' excitement about it.
