Experience four spine-tingling tales of terror in their original screenplay format! The Witching Hour: In 1884, a small, quiet, New England town unleashes its religious wrath on an unsuspecting mother and daughter. Diabolical: A horrifying doomsday plot is uncovered by communications expert Nathan Adams after he and his family move to a small New England town where Nathan has just accepted his dream job. Reign of Terror: When F.B.I. Agent John Salleum investigates a bizarre murder scene at a cryptic mansion, he uncovers an unspeakable evil far greater and closer than he ever imagined. The House on the Empty Lot: After building an addition to their current home, the Tallman family experiences terror beyond imagination when they discover their house is now haunted: not by ghosts or poltergeists, but another house.

Often the finest artists do not make the best teachers. Many frustrated college students of art know this all too well as they suffer through unstructured classes with inexperienced teachers or graduate student instructors. In these situations, it is easy to blame the teachers. But the problem is largely institutional: most students graduating with MFAs from art schools receive little if any instruction in teaching art. If you find yourself in this predicament as teacher or student, this book is for you. The first book to provide a comprehensive guide for teaching college-level art, The Art of Teaching Art is the culmination of respected artist and instructor Deborah Rockman's two decades of teaching experience. Believing that drawing is the backbone of all of the visual arts, she begins with a complete explanation of drawing concepts that apply to any subject matter, e.g., composition, sighting processes, scaling techniques, and methods for linear and tonal development. She then illustrates these concepts with step-by-step methods that easily translate to classroom exercises. Next, she applies the drawing principles to every artist's most important and challenging subject, the human figure. After an extended section on understanding and teaching perspective that explores illusionistic form and space, the focus of the book shifts to the studio classroom itself and the essential elements that go into making an effective learning environment and curriculum. From preparing materials lists and syllabi, to setting up still-lives, handling difficult classroom situations, critiquing and grading student artworks, and shooting slides of student artworks, she leaves no stone unturned.

As the profound contribution of mental illness to disability, morbidity, and mortality has gained acceptance, mental health has grown into a global priority. One in five experience mental illness in their lifetime, and those who suffer are coming forward in unprecedented numbers. As more people seek care for themselves and others, providers are increasingly unable to meet the demand through existing systems and mental health care approaches. In Managing Uncertainty in Mental Health Care, Drs. Patricia Rockman and José Silveira critically examine core assumptions informing the primary approaches currently used to assess mental illness in clinical settings, with an emphasis on clinician certainty. They illustrate how current diagnostic frameworks obscure clinician uncertainty while encouraging overconfidence and go on to consider potential strategies for lessening the impact of inevitable errors. Ultimately, this book makes a case for acknowledging the fallibility of clinical judgment, independent of competence and experience, and the need to modify approaches to mental health care so that they align with the irreducible uncertainty of the domain. By exploring emerging transdiagnostic approaches to mental health care in terms of their alignment with irreducible uncertainty, Rockman and Silveira make space for error and offer clinicians a novel way to advance the fundamental aim of mental health care: to reduce the harm and suffering of all.

This book provides a thorough introduction to the topic of mathematical modeling of electrical activity in the heart, from molecular details of ionic channel dynamics to clinically derived patient-specific models. It discusses how cellular ionic models are formulated, introduces commonly used models and explains why there are so many different models available. The chapters cover modeling of the intracellular calcium handling that underlies cellular contraction as well as modeling molecular-level details of cardiac ion channels, and specialized topics such as cardiomyocyte energetics and signalling pathways. It is an excellent resource for experienced and specialized researchers in the field, but also biological scientists with a limited background in mathematical modelling and computational methods. Key Features Thorough introduction to the topic of mathematical modeling of electrical activity in the heart Focuses on use of experimental data in mathematical modeling, and on explanations rather than equations In addition to being experts in the field, the contributing authors are expert science communicators

This book facilitates an integrative understanding of the development, genetics and evolution of butterfly wing patterns. To develop a deep and realistic understanding of the diversity and evolution of butterfly wing patterns, it is essential and necessary to approach the problem from various kinds of key research fields such as “evo-devo,” “eco-devo,” “developmental genetics,” “ecology and adaptation,” “food plants,” and “theoretical modeling.” The past decade-and-a-half has seen a veritable revolution in our understanding of the development, genetics and evolution of butterfly wing patterns. In addition, studies of how environmental and climatic factors affect the expression of color patterns has led to increasingly deeper understanding of the pervasiveness and underlying mechanisms of phenotypic plasticity. In recognition of the great progress in research on the biology, an international meeting titled “Integrative Approach to Understanding the Diversity of Butterfly Wing Patterns (IABP-2016)” was held at Chubu University, Japan in August 2016. This book consists of selected contributions from the meeting. Authors include main active researchers of new findings of corresponding genes as well as world leaders in both experimental and theoretical approaches to wing color patterns. The book provides excellent case studies for graduate and undergraduate classes in evolution, genetics/genomics, developmental biology, ecology, biochemistry, and also theoretical biology, opening the door to a new era in the integrative approach to the analysis of biological problems. This book is open access under a CC BY 4.0 license.

This is the only book of its kind to provide an overview of the science of flavonoids in plants.

This book is devoted to innovative medicine, comprising the proceedings of the Uehara Memorial Foundation Symposium 2014. It remains extremely rare for the findings of basic research to be developed into clinical applications, and it takes a long time for the process to be achieved. The task of advancing the development of basic research into clinical reality lies with translational science, yet the field seems to struggle to find a way to move forward. To create innovative medical technology, many steps need to be taken: development and analysis of optimal animal models of human diseases, elucidation of genomic and epidemiological data, and establishment of “proof of concept”. There is also considerable demand for progress in drug research, new surgical procedures, and new clinical devices and equipment. While the original research target may be rare diseases, it is also important to apply those findings more broadly to common diseases. The book covers a wide range of topics and is organized into three complementary parts. The first part is basic research for innovative medicine, the second is translational research for innovative medicine, and the third is new technology for innovative medicine. This book helps to understand innovative medicine and to make progress in its realization.
