The present book on the Biodiversity of Ranthambhore Tiger Reserve deals with 539 species of higher plants and 361 species of animals (vertebrates). Besides geographical position and topography, the abiotic components, viz. geology, soils, water, climatic conditions etc., which determine the composition of biota in an ecosystem, have been discussed in details. Correct and valid names have been adopted for the floral and faunal elements

along with local and English names. The keys have been provided for plant species from infra-specific to family level for easy identification. The short diagnostic description, phenology, ecology and distributional aspects have been provided under each plant species. Besides statistical analysis of floral composition, the phytogeographical and biological spectra have also been worked out to determine the routes of migration and phytoclimate respectively. Bioperspective value of the Reserve has been assessed to determine the economic potentiality and sustainable utilization of bioresources. The faunal diversity includes vertebrate fauna only, arranged in a classified manner. The shelter

and feeding habits along with dependency of fauna on vegetation have been provided to determine plant-animal relationship and flow of energy. Details about endemic and threatened species of plants and animals, along with causes of threats, have been given for proper management of the Reserve. About 107 colour photographs of habitat and plants and animals with 36 illustrations of plant species have been provided. Several maps, pie charts, graphs, figures etc, along with data-tables, are appended to illustrate the findings. It is hoped that the book will prove a milestone in the management of the Reserve.

The Aravalli ranges are one of the oldest mountain systems of the

world which have the oldest granitic and gneissic rocks at their base, overlain by the rocks of the Aravalli Super groups. These rocks are highly metamorphosed at certain places and show rich occurrences of minerals of great commercial importance. The Aravalli ranges are fairly rich in floral diversity and man and other organisms have to depend solely on these bioresources.

Early anthropological evidence for plant use as medicine is 60,000 years old as reported from the Neanderthal grave in Iraq. The importance of plants as medicine is

further supported by archeological evidence from Asia and the Middle East. Today, around 1.4 billion people in South Asia alone have no access to modern health care, and rely instead on traditional medicine to alleviate various symptoms. On a global basis, approximately 50 to 80 thousand plant species are used either natively or as pharmaceutical derivatives for life-threatening conditions that include diabetes, hypertension and cancers. As the demand for plant-based medicine rises, there is an unmet need to investigate the quality, safety and efficacy of these herbals by the “ scientific methods ” . Current research on drug discovery from medicinal plants involves a multifaceted approach combining botanical,

phytochemical, analytical, and molecular techniques. For instance, high throughput robotic screens have been developed by industry; it is now possible to carry out 50,000 tests per day in the search for compounds, which act on a key enzyme or a subset of receptors. This and other bioassays thus offer hope that one may eventually identify compounds for treating a variety of diseases or conditions. However, drug development from natural products is not without its problems. Frequent challenges encountered include the procurement of raw materials, the selection and implementation of appropriate high-throughput bioassays, and the scaling-up of preparative procedures. Research scientists

should therefore arm themselves with the right tools and knowledge in order to harness the vast potentials of plant-based therapeutics. The main objective of Plant and Human Health is to serve as a comprehensive guide for this endeavor. Volume 1 highlights how humans from specific areas or cultures use indigenous plants. Despite technological developments, herbal drugs still occupy a preferential place in a majority of the population in the third world and have slowly taken roots as alternative medicine in the West. The integration of modern science with traditional uses of herbal drugs is important for our understanding of this ethnobotanical relationship.

Volume 2 deals with the phytochemical and molecular characterization of herbal medicine. Specifically, it focuess on the secondary metabolic compounds, which afford protection against diseases. Lastly, Volume 3 discusses the physiological mechanisms by which the active ingredients of medicinal plants serve to improve human health. Together this three-volume collection intends to bridge the gap for herbalists, traditional and modern medical practitioners, and students and researchers in botany and horticulture.

This book focuses on an illustration and photographs of family Malvaceae as the basis of morphological characters such as habit of plant and plant parts will be an added advantage to a non-botanist to identify the species. An artificial key to the tribes, species and sub-species as the keys to success. Probably illustration and photographs of each species is first time used for the flora of Rajasthan. In addition, easy to use keys with an emphasis on field characteristics have been provided. Only those localities from where actual collections known the author have been made,

Therefore, the valuable suggestions are welcomed. The small plant guide to the flora of Malvaceae Sitamata wildlife Sanctuary book deals with 11 illustrations and more than 29 coloured photographs have added to the value of this study.
