The book, Teaching and Learning for Adult Skill Acquisition: Applying the Dreyfus and Dreyfus Model in Different Fields, will fill a unique niche in the field of adult, higher, and workforce education. It offers a current volume for scholars and practitioners based on both empirical studies and practice-based research on adult skill acquisition and development. Dreyfus and Dreyfus (1980, 1988, 2004, 2008) developed the novice to expert model of skill acquisition that illustrates growth over the course of a person's career in a particular domain. The skill model highlights a learner's movement across six levels of skill development: novice, advanced beginner, competent, proficient, expert, and mastery. This book will present examples of the application of the Dreyfus and Dreyfus model in different fields (i.e., health care, education, law enforcement, business, serious gaming, military, ethics training, etc.) providing insight into how practitioners can develop their skills in their particular domains and how educators can promote this development. This collection will be appropriate for a wide variety of professors, researchers, practitioners, and students in the field of adult, higher, and workforce education.

Learning progressions - descriptions of increasingly sophisticated ways of thinking about or understanding a topic (National Research Council, 2007) - represent a promising framework for developing organized curricula and meaningful assessments in science. In addition, well-grounded learning progressions may allow for coherence between cognitive models of how understanding develops in a given domain, classroom instruction, professional development, and classroom and large-scale assessments. Because of the promise that learning progressions hold for bringing organization and structure to often disconnected views of how to teach and assess science, they are rapidly gaining popularity in the science education community. However, there are significant challenges faced by all engaged in this work. In June 2009, science education researchers and practitioners, as well as scientists, psychometricians, and assessment specialists convened to discuss these challenges as part of the Learning Progressions in Science (LeaPS) conference. The LeaPS conference provided a structured forum for considering design decisions entailed in four aspects of work on learning progressions: defining learning progressions; developing assessments to elicit student responses relative to learning progressions; modeling and interpreting student performance with respect to a learning progressions; and using learning progressions to influence standards, curricula, and teacher education. This book presents specific examples of learning progression work and syntheses of ideas from these examples and discussions at the LeaPS conference.
